Composition of steareptene from Bulgarian rose oil. CH
 II. Saturated hydrocarbons other than siccane. D. Ivanov, Ch. Ivanov, and B. Stolanova-Ivanova (Univ. Soda). *Compt. rend. acad. Bulg. Sci.* 7, 143, 1, 17-20 (1964) (in French); cf. C.A. 48, 12373g. The hydrocarbon fraction (I) (78.8%), obtained by passing steareptene through alumina, is crystd. from EtOH, giving siccane (II), m. 38° (62.1% of I). The mother liquors from II fractionally distd. at 0.7-0.8 mm., treated with Be in CCl₄ to remove unsatd. hydrocarbons present in I, redistd. twice at 0.4-0.5 mm., and the fractions crystd. from EtOH give *heptadecane* (III), m. 22.5-23.5°, b.m. 301.1°, *nonadecane* (IV), m. 32.8-33.8°, b.m. 328.5°, *heneicosane* (V), m. 40-41°, b.m. 343.9°, and a fraction, m. 13-15°, b.m. 276.4°, probably *pentadecane* (VI) contaminated with *hexadecane* (VII). No *octadecane* (VIII) is isolated. Detg. the b.p. of II and VII and graphically inter- and extrapolation gives the following values (compd. and b.p./0.4 mm. given): VI, 81°; VII, 88°; III, 96°; VIII, 102°; IV, 108°; II, 114°; V, 120°. A.W.S.

TITLE: Unsaturated hydrocarbon content in wax from concentrated attar of Bulgarian rose petals
15.44

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 2, 1965, 141-144

TOPIC TAGS: hydrocarbon, wax, botany

ABSTRACT: D. Ivanoff et al. (Compt. rend. Acad. bulg. Sci., 8, 1955, No 2, 33) studied earlier the hydrocarbon composition of the wax from concentrated attar of Bulgarian roses. In the present investigation, using the same raw material, the authors established the amount and the structure of various unsaturated hydrocarbons found in wax from concentrated attar of Bulgarian roses. The results are presented in the form of tables. Since the hydrogenation of unsaturated hydrocarbons can lead to saturated ones, the authors suspect that this could, perhaps, be the path followed by vegetable cells during their production of saturated hydrocarbons with even or odd number of carbon atoms. Orig. art. has: 2 tables.

TITLE: Composition of alcohols found in wax from concentrated attar of Bulgarian rose petals

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 2, 1965, 145-148

TOPIC TAGS: alcohol, wax, botany

ABSTRACT:

This is a continuation of earlier studies of D. Ivdnoff et al. (Compt. rend. Acad. bulg. Sci., 8, 1955, No 2, 33) concerning the chemical composition of concentrated attar of Bulgarian rose petals. This time the authors concentrated on the composition of the alcohol fraction of the same wax used during the earlier phases of the research. Tests uncovered the following normal saturated alcohols: (C₂₀H₄₁OH), docosanol-(1) (C₂₂H₄₅OH), tetracosanol-(1) (C₂₄H₄₉OH), hexacosanol-(1) (C₂₆H₅₃OH), and octacosanol-(1) (C₂₈H₅₇OH). Orig. art. has: 2 tables.

TEXT: The authors present results of research work conducted in the weld-
ing department of the Laboratory of technical materials at the Technical Insti-
tute in Timishoar (RNR). The process of alloying built-up metal in arc hard-
facing of low carbon steels was studied. In manual welding the alloying elements
were added to the coating, and in automatic welding to the ceramic fluxes. Al-
loying with two elements, Cr and Mn, is discussed. The Mn content in the built-
up metal varied within a range of 0.7 - 16.5%. At a Mn content as high as 2 -
2.5%, martensite appears; at 3.1 - 3.2% the structure becomes entirely marten-
sitic and at 3.5 - 4.0% austenite appears and cracks are forming. Hardness of
the built-up metal with variable Mn content is highest at 3.1 - 3.2%. The Cr

A006/A101

content in the built-up metal varied between 2.5 to 12.5%. Already at a Cr content as high as 2.0 - 2.5 %, secondary cementite appeared and hardness increased. At a further gradual increase of the Cr content acicular ferrite austenite and γ -phase appear in the structure, and the hardness of the built-up metal decreases. The hardness of the built-up metal is not a decisive factor, predetermining the proneness to crack formation. The structure plays also an important part: in case of a homogeneous and fine-grained structure, cracks are not formed. Fields for the use of ceramic Fe-Mn and Fe-Cr containing fluxes are recommended.
